

Project Planning Report

On

Tumor detection using AI

Submitted by

**ARYAN JADHAV
SOHAM BHOSAGE
GANRAJ KENDRE
VARNAN DHONDGE**

Under the guidance of

Prof. PRERNA PATIL

In partial fulfillment of

Diploma in *COMPUTER ENGINEERING*

[2022-2023]

At

DEPARTMENT OF COMPUETR ENGINEERING

MIT POLYTECHNIC

PUNE-411038

Affiliated to

Certificate

This is to certify that Mr. ARYAN JADHAV From (institute) MIT Polytechnic, Pune having Enrollment number : 2001480044 has completed ***Project Planning Report*** having title TUMOR DETECTION USING AI

In a group consisting of candidates under the guidance of Guide name Prof. PRERNA PATIL.

Name & Signature of Guide

Name & Signature of HOD

Acknowledgement

It is our privilege to express our sincerest regards to our project guide, Prof. PRERNA PATIL, for her valuable inputs, able guidance, encouragement, whole-hearted cooperation and constructive criticism throughout the duration of our project.

We deeply express our sincere thanks to our Principal Dr. **Prof. R. S. Kale** and Head of COMPUTER ENGINEERING Department Prof. J. G. Mante (Khurpade).

We take this opportunity to thank all our lecturers who have directly or indirectly helped our project.

ARYAN JADHAV

SOHAM BHOSAGE

Diploma in **Computer engineering**

Abstract

Radiology is a broad subject that needs more knowledge and understanding of medical science to identify tumors accurately. The need for a tumor detection program, thus, overcomes the lack of qualified radiologists. Using magnetic resonance imaging, biomedical image processing makes it easier to detect and locate brain tumors. In this study, a segmentation and detection method for brain tumors was developed using images from the MRI sequence as an input image to identify the tumor area. This process is difficult due to the wide variety of tumor tissues in the presence of different patients, and, in most cases, the similarity within normal tissues makes the task difficult. The main goal is to classify the brain in the presence of a brain tumor or a healthy brain. The proposed system has been researched based on Berkeley's wavelet transformation (BWT) and deep learning classifier to improve performance and simplify the process of medical image segmentation. Significant features are extracted from each segmented tissue using the gray-level-co-occurrence matrix (GLCM) method, followed by a feature optimization using a genetic algorithm. The innovative final result of the approach implemented was assessed based on accuracy, sensitivity, specificity, coefficient of dice, Jaccard's coefficient, spatial overlap, AVME, and FoM.

Table of Contents

CONTENTS	
1.	- Introduction and background of the Industry or User based Problem
	1.1 Motivation
	1.2 Background
	1.3 Need Of The Project
	1.4 Introduction of Project
2.	- Literature Survey for Problem Identification and Specification
3.	- Proposed Detailed Methodology of solving the identified problem with action plan
	3.1 Problem Definition
	3.2 Proposed Methodology
	3.3 Resources Required
	3.4 System Architecture
	3.5 Project Design
	3.5.1 ER Diagram

	3.5.3 Activity Diagram
	3.5.4 DFD Diagram (DFD Level 0 and 1)
	3.6 Action Plan

Introduction and background of the Industry or User based Problem

- **Motivation**

Cancer is one of the leading problems in the world today. There are about 18.1 million cancer patients in the world today. Cancer can be difficult to detect in the early stages. We can use Artificial Intelligence to find out patterns in the reports of patients in the early stages and help in the prevention of cancerous tumors from growing any further.

- **Background**

Artificial intelligence is a computer program or algorithm that uses past data to make future predictions. It teaches itself how to analyse and interpret data, which helps machine learning algorithms pick up on patterns that are not readily discernible to the human eye or brain. As these algorithms are exposed to more new data, their ability to learn and interpret the data improves. Researchers have also used deep learning, a type of machine learning, in cancer imaging applications. Deep learning refers to algorithms that classify information in ways much as the human brain does. Deep learning tools use “artificial neural networks” that mimic how our brain cells take in, process, and react to signals from the rest of our body. Research on AI for cancer imaging: Studies suggest that AI has the potential to improve the speed, accuracy, and reliability with which doctors answer those questions. But what scientists are most excited about is the potential for AI to go beyond what humans can currently do themselves. AI can “see” things that we humans can’t, and can find complex patterns and relationships between very different kinds of data.

- **Need of The Project**

AI can “see” things that we humans can’t, and can find complex patterns and relationships between very different kinds of data. AI can be more reliable when it comes to identifying if a tumor is cancerous or not. The accuracy of AI is reliable enough to be used in real life. This can help radiologists with the identification of tumors. This can also help the doctors, as AI can help to identify some specific features or symptoms of the tumor. This can further help doctors to learn about Cancer.

- **Introduction of project**

As a result, the radiology department has gained prominence in the study of brain tumors using imaging methods. Many studies have looked at the causes of brain tumors, but the results have not been conclusive. FCM helps to increase accuracy. Amato et al. structured PC-assisted recognition using mathematical morphological reconstruction (MMR) for the initial analysis of brain tumors. Test results show the high accuracy of the segmented images while significantly reducing the time of calculation. In classification of neural deep learning systems was proposed for the identification of brain tumors. Discrete wavelet transformation (DWT), excellent extraction method, and main component analysis (PCA) were applied to the classifier here, and performance evaluation was highly acceptable across all performance measurements.\

In , a new classifier system was developed for brain tumor detection. The proposed system achieved 92.31% of accuracy. In , a method was suggested for classifying the brain MRI images using an advanced machine learning approach and brain structure analytics. To identify the separated brain regions, this technique provides greater accuracy and to find the ROI of the affected area. Researchers in [proposed a strategy to recognize MR brain tumors using a hybrid approach incorporating DWT transform for feature extraction, a genetic algorithm to reduce the number of features, and to support the classification of brain tumors by vector machine (SVM) . Specific segmentation concepts include region-based segmentation edge-based technique , and thresholding technique for the detection of cancer cells from normal cells. Common classification method is based on the Neural Network Classifier , SVM Classifier , and Decision Classifier . In , a brain tumor detection method was developed using the GMDSWS-MEC model. The result shows high accuracy and less time to detect tumors.

Artificial intelligence -

Properly from 2000 to 2015

- AI is becoming more and more open-minded.
- In 1950, Turing presented the famous “Turing Test” which defined the concept of “Machine Intelligence”
- McCarthy persuaded participants to accept the concept of “Artificial Intelligence”
- 1965 It is likewise the beginning of the first “Golden age” of AI
- AI aims to extend and augment the capacity and efficiency of mankind in tasks of remaking nature and governing the society through intelligent machines, with the final goal of realizing a society where people and machines coexist harmoniously together.

Machine learning -

Nowadays, large amount of data is available everywhere Therefore, it is very important to analyze this data in order to extract some useful information

- Machine learning is an integral part of artificial intelligence
- used in various fields such as bioinformatics, intrusion detection, Information retrieval, game playing, marketing, malware detection, image deconvolution and so on
- It is the most effective method used in the field of data analytics in order to predict something
- These analytical models allow researchers, engineers, data scientists and analysts to produce reliable and valid results and decisions.

Cancer detection using ML –

Nowadays, Machine learning is increasingly being employed in cancer detection and diagnosis.

- in the future and we can predict it without the need of going to the hospitals.
- the user has to enter data to get result.
- attributes like clump thickness, uniform cell size, uniform cell shape ,radius, texture, perimeter, area etc.
- the prediction result will be whether the cancer is malignant or benign
- A tumor contains cancer cells that can spread to places of the body.
- This is the top cause of mortality among women worldwide,
- it is one of the most frequent and life-threatening malignant tumors.

Importance of cancer detection –

High incidence of oral carcinoma and its late-stage presentation are the major global healthcare issues

- The World Health Organization (WHO) has set early diagnosis and prevention of oral cancer as their primary objective
- It is important to consider the time of oral screening, as it plays a pivotal role in understanding the disease prognosis
- oral screening can improve the chances of patient's survival
- lack of public awareness and delays from primary health care centers are few of the major parameters that contribute to patient's mortality and morbidity
- It enhance early stage diagnosis of cancer and have a positive impact on patient's survival.

Proposed Detailed Methodology of solving the identified problem with action plan

Problem definition :

Cancer is the leading cause of death in the world. This disease is characterized by the development of abnormal cells that divide uncontrollably and have the ability to infiltrate and destroy normal body tissue. Cancer often has the ability to spread throughout your body.

Signs and symptoms caused by cancer will vary depending on what part of the body is affected.

Some general signs and symptoms associated with, but not specific to, cancer, include:

- Fatigue.
- Lump or area of thickening that can be felt under the skin.
- Weight changes, including unintended loss or gain.
- Changes in bowel or bladder habits

Cancer is caused by changes (mutations) to the DNA within cells. The DNA inside a cell is packaged into a large number of individual genes, each of which contains a set of instructions telling the cell what functions to perform, as well as how to grow and divide. Errors in the instructions can cause the cell to stop its normal function and may allow a cell to become cancerous. This is how cancer is formed in the body.

Proposed Methodology :

The technique used for making this model work is CNN (Convolutional Neural Network). The different stages by which CNN is applied to the dataset are

1. At first, the required packages are imported.
2. Then the folder where the dataset is stored is imported.
3. Image reading is done after that it is labeled (such as 0 for benign and 1 for malicious) and then the reports are stored in the data frame.
4. Then the size of the image is changed to 224*224 and the shape of the image is.
5. Image normalization is a complete training dataset and a validation dataset was used for evaluating the model.
6. Then the accuracy of the model is evaluated using the test images.
7. The loss graph and the accuracy graph are plotted.

The entire implementation is done using python 3.8 and is executed on Google Colaboratory and the model is stored in Google Drive

Results :

Figure 3. Model loss

When the model is applied to the testing data set for 10 epochs, a validation accuracy of 82.86% is obtained and the validation loss is also less.

As seen in figure 3, when the model is applied to the validation, then a high loss is obtained but once applied to the testing set, the loss gradually decreases with the increasing number of epochs

Figure 4. Model accuracy

. The accuracy of the convolutional neural network model achieved after applying it to the testing set was 97.79%. with a very minimal loss with increasing epochs. The difference in model accuracy can be seen between the validation dataset and the training dataset.

Figure 5. Experimental results

Block Diagram Description:

We collect the information either in the form of MRI images or MRI reports and then Pre-process them then the AI will detect some features or patterns in the data which is based on the data entered into the AI algorithm in the training sets. These Features will be classified by the classifier as either tumourous or non-tumourous.

Resources required:

RAM	8GB
HARD DISK	40GB
KEY BOARD	Standard windows keyboard
MOUSE	Two or three button mouse
MONITOR	LCD/LED
OPERATING SYSTEM	WINDOWS 11
CODING LANGUAGE	PYTHON
EDITOR	PYCHARM OR VS CODE
